## Weight and Balance

From the desk of Paul D Bessler

License: 2718447 AFP

Registration No. N6038  
Glider Mfg. Start & Flug

Serial No. 14  
Model: H-101 Salto

Leveling means: Slope of rear top fuselage : 100 to 6

Datum point : Wing leading edge 100mm (4") outwards wing/fuselage gap

Weight on main gear :  $W_1 = \underline{405}$  lbs.  
Weight on tail wheel :  $W_2 = \underline{50}$  lbs.  
Total weight :  $W_T = \underline{455}$  lbs.  $W_1 + W_2$

Distance a :  $a = \underline{6.41}$  in.  
Distance b :  $b = \underline{145.5}$  in.  
Center of gravity (CG empty) :  $x = \underline{22.40}$  in.

$$CG = x = \frac{(W_2)(b)}{W_T} + a$$
$$x = \frac{(50)(145.5)}{(455)} + 6.41$$
$$x = \underline{22.40}$$

List of equipment included: Airspeed  
Altimeter  
G-meter  
Compass  
Mechanical vario  
Clock  
Attitude gyro (14v)  
Directional gyro (14v)  
2 batteries (14v)  
22 ft<sup>3</sup> O<sub>2</sub> bottle and equipment [ station = 21.5 in. wgt = 11.95 lbs ]  
(full vs empty less than 2 lbs)

## Flying weight CG

Empty CG: 22.40 in.

Flying weight CG Limits: 9.25 to 13.18 in.

Max. Gross weight: 683 lbs

Pilot position from datum: -9.55 in. (ie 9.55 inches *in front of datum*)

Formulae allow for negative, so enter pilot arm without sign.

**Max pilot weight with chute:** = PH

$$PH = \text{Max gross weight} - \text{empty weight} \text{ (ie WT)}$$

$$PH = \underline{683} \text{ lbs} - \underline{455} \text{ lbs} = \underline{228} \text{ lbs}$$

**Check CG for MAX pilot weight:**  $x = \frac{(WT)(CG \text{ empty}) - (PH)(Pilot \text{ arm})}{\text{Max gross weight}}$

$$x = \frac{(455)(22.40) - (228)(9.55)}{683}$$

$$x = \underline{11.73} \text{ in.} \quad \{\text{allowed } 9.25 \text{ to } 13.18 \text{ in.}\}$$

Therefore, 228 lbs max pilot wgt is OK / not OK.

**MIN. pilot weight with chute PL:**

Develop formula (x = max rear CG = 13.18):

$$x = \frac{(WT)(CG \text{ empty}) - (PL)(Pilot \text{ arm})}{WT + PL}$$

Solve for PL

$$(PL)(x) + (PL)(Pilot \text{ arm}) = (WT)(CG \text{ empty}) - (WT)(x)$$

$$(PL)(x + Pilot \text{ arm}) = (WT)(CG \text{ empty} - x)$$

thus  $PL = \frac{(WT)(CG \text{ empty} - x)}{(x + pilot \text{ arm})}$

$$PL = \frac{(455)(22.40 - 13.18)}{(13.18 + 9.55)} \quad \text{..... enter data here}$$

$$PL = \underline{184.6} \text{ lbs}$$

Therefore, 184.6 lbs is min. pilot (plus chute) weight.
